

Nebula Setups 2.x version history

2.6 release (May 14th, 2016)

- support for 32 and 64 bit AAX setups (Windows, OS X)
- support for 32 and 64 bit Juce based AU setups (OS X)
- new AAX and AU options in Save dialog and Setups manager
- new option »**Rescan**« in Setups and ACQUA manager - forces rescan of plugins
- overhauled Preferences window (each setup format now has its own tab – VST, AU, AAX)
- new AAX related tweak – PLUGINTYPE (Pro Tools plugin category)
- additional ACQUA plugin definitions and skin thumbnails
- ACQUA C++ programming library updated to version **1.4.010** – this should fix crashes at program startup with some configurations
- if (some of) setup's programs are not present in Nebula repository when opening a setup, error message is displayed
- bugfix: to avoid possible crash, setup preview now checks for the actual existence of a plugin to be previewed
- bugfix: plugin version was not always retrieved properly
- bugfix: setup renaming could fail under some circumstances

2.5.1 release (September 4th, 2015)

- new "Factory name" parameter in ACQUA plugin editor – it should contain the original ACQUA plugin name (without extension). This is required ONLY if you rename ACQUA plugins to different names than original.
- "Save" dialog now includes "Settings" button for the last moment settings changes before saving
- additional diagnostic related to version information (both Setups and ACQUA Plugins managers)
 - "**Not available**" – plugin is not installed or can't be found for some other reason(s)
 - "**Version info error**" - plugin has been found and loaded, but something went wrong (incorrect/corrupt installation etc.), so its version couldn't be retrieved
- information about setup's default (autoload) program is now displayed in the status line
- when saving AU setup, program checks if MAGIC parameter tweak is present - if not, a warning is generated. This is to avoid possible issues with AU setups non-detection in AU host programs. Note that Setups Manager does not perform this check.
- added PEARL, OCHRE, SCARLET and VERSATILE ACQUA plugin definitions
- ACQUA plugin editor now shows warning only when you try to cancel/discard actual changes
- updated ACQUA programming library
- bugfixes
- updated User's Manual PDF

2.5 release (June 15th, 2015)

- Mac OS X: full support for 64 bit AU (Audio Units) based setups
- ACQUA plugins management (engine updating)
- skin selector now shows images (more than 100 skin thumbnails provided)
- backup option when updating setups or ACQUA plugins
- version information for setups and ACQUA plugins
- Quick Guide PDF renamed to User's Manual PDF – updated with 2.5 features
- Mac OSX: new installation package

2.2 release (October, 17th, 2014)

- Nebula parameter tweaks improvements (local and global tweaks)
- Nebula parameter tweaks list - copy/paste functionality
- support for ACQUA plug-in content/programs
- support for decrypted skins
- new XML formatted screen layout file
- ACQUA dynamic programming library updated to version 1.3.786
- Quick Guide PDF updated
- Version History and Nebula Tools FAQ PDF files now included with the installation package
- Mac OS X: QT framework updated to version 4.8.5
- Mac OS X bug fixed: setup preview was very unstable (crashing)
- Mac OS X Mavericks bug fixed: application font was not aligned properly

2.1 release (May, 15th, 2014)

- Setup preview (Nebula VST plug-in hosting)
- Setup editor: improved visibility of program items when moved with "Move selected programs up/down" functions
- bug fixed: setup's name **can not** be the same as base Nebula plug-in's name – this may lead to unexpected problems
- bug fixed: in some cases, tweaks were not included in setups when using Setups Manager
- bug fixed: Setups Manager hasn't correctly (re)created/updated setups with programs which contain "&" in their names
- bug fixed: using dots in setup's name caused problems when loading VST setup

2.0 initial release (November 12th, 2013)
